

## How animals have adapted to their habitat

By Rohan

You may wonder: how did animals adapt to their habitats? Well, if you are reading this you have come to the right place and read on, if you aren't reading this then farewell.

Snow leopards have adapted to their environment by adapting small round ears to help minimize heat loss, and their wide feet help distribute their body weight.

Octopi have adapted to their habitat by being able to spray ink and camouflage to get away from predators and to sneak up on prey.

Peregrine falcons have adapted by growing pointy wings having good eyesight and having their feet bigger to catch bigger prey

Giraffes have adapted by growing long necks to reach vegetation, they are now the worlds tallest mammals.
